# A bit more on **Microplastics**

Primary & Secondary

THEY WEREN'T ALWAYS SO SMALL...

Images: OSU, IFAS/UFL

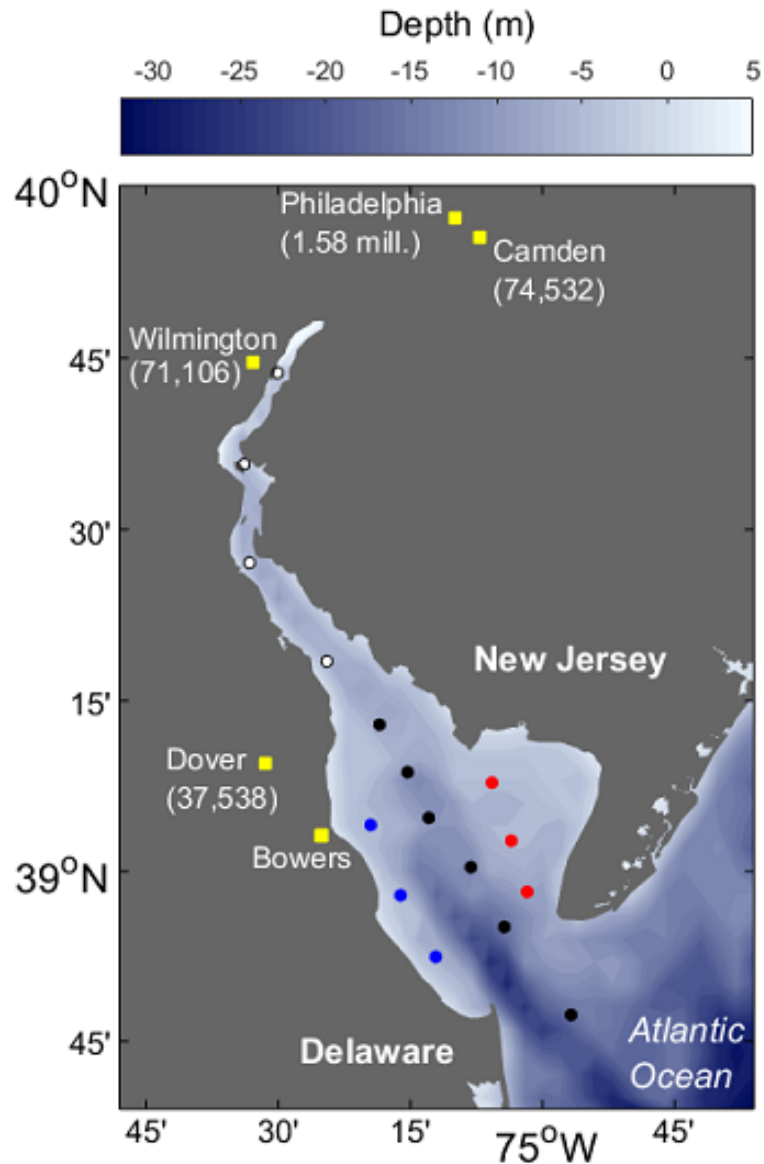

**So instead of floating garbage patches, ocean plastic pollution looks more like a soup**

# Seasonal Zooplankton Sampling 2014-2018

- 1) MP in Inland Bays
- 2) MP in Delaware Bay

**Are microplastics an  
environmental concern  
in Delaware Bay and the  
Inland Bays?**

## RESEARCH QUESTION

Is the microparticle concentration in Delaware's Inland Bays more comparable to that of Delaware's rivers or of the Delaware Bay?

St. Jones &  
Murderkill  
Rivers

4.5

0.7

Rehoboth Bay

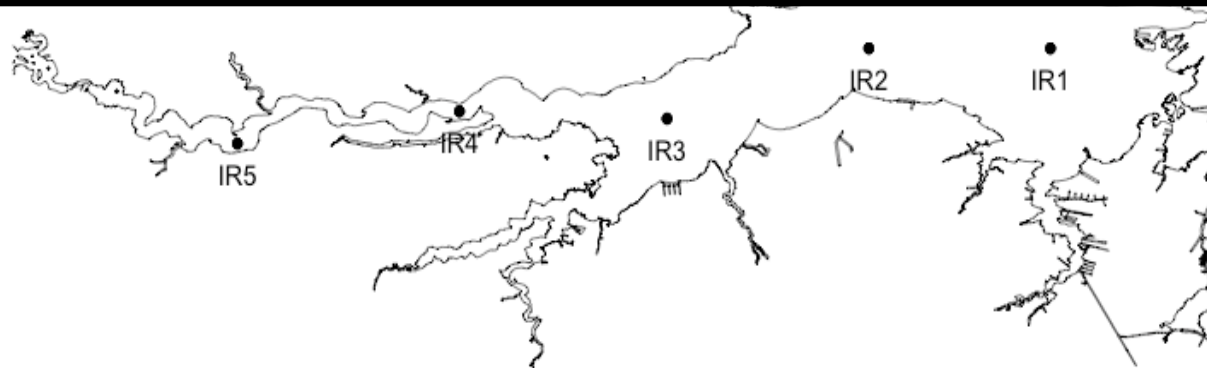

Indian River Bay

?

# APPROACH

- (1) Collect & quantify microparticles using net-based digestion and grab-based fluorescence approaches
- (2) Analyze polymer composition of microparticles to determine microplastic identity & quantify microplastics

# METHODS: WET PEROXIDE OXIDATION

Net-Based Collection

Size Fractioning,  
Wet-Peroxide Oxidation,  
& Density Separation  
(Masura et al. 2015)

Enumeration &  
Categorization

Micro-FTIR Analysis

# METHODS: NILE RED STAIN

Water-Grab Collection

Filtration

Staining

Fluorescence and Enumeration

# JULY 29 (NET-BASED COLLECTION): MICROPARTICLE CONCENTRATION

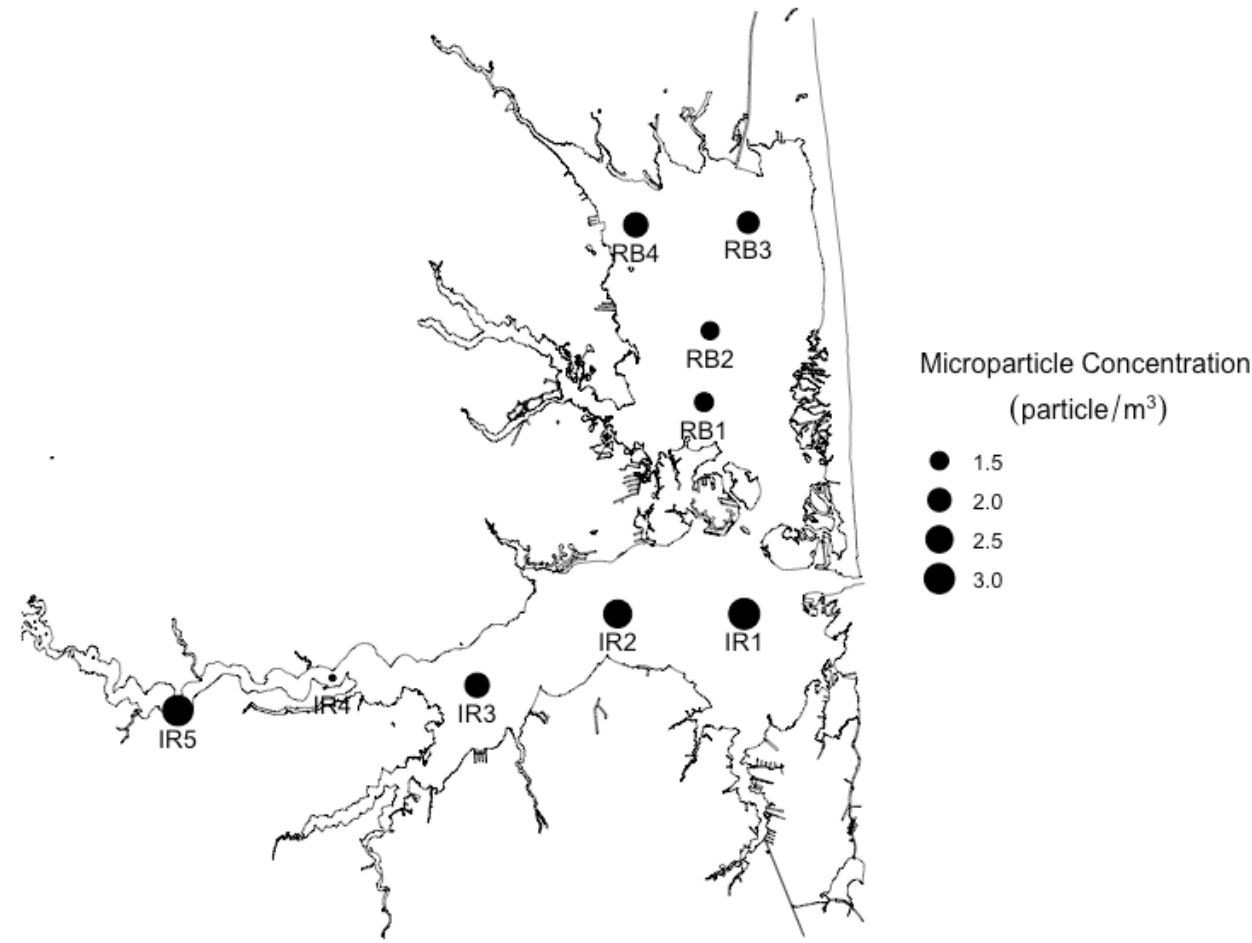

- Indian River Bay average microparticle concentration:  $2.4 \pm 0.9$  pieces/m<sup>3</sup>
- Rehoboth Bay average microparticle concentration:  $1.8 \pm 0.3$  pieces/m<sup>3</sup>

Delaware  
Tidal  
Creeks

Inland  
Bays

Delaware  
Bay

$3.5 \text{ pieces/m}^3 > 2.1 \text{ pieces/m}^3 > 0.7 \text{ pieces/m}^3$

IR = Indian River Bay; RB = Rehoboth Bay

# JULY 29 (NET-BASED COLLECTION): MICROPARTICLE SHAPE

## Indian River Bay

Fibers: 78.3%

Fragments: 21.7%

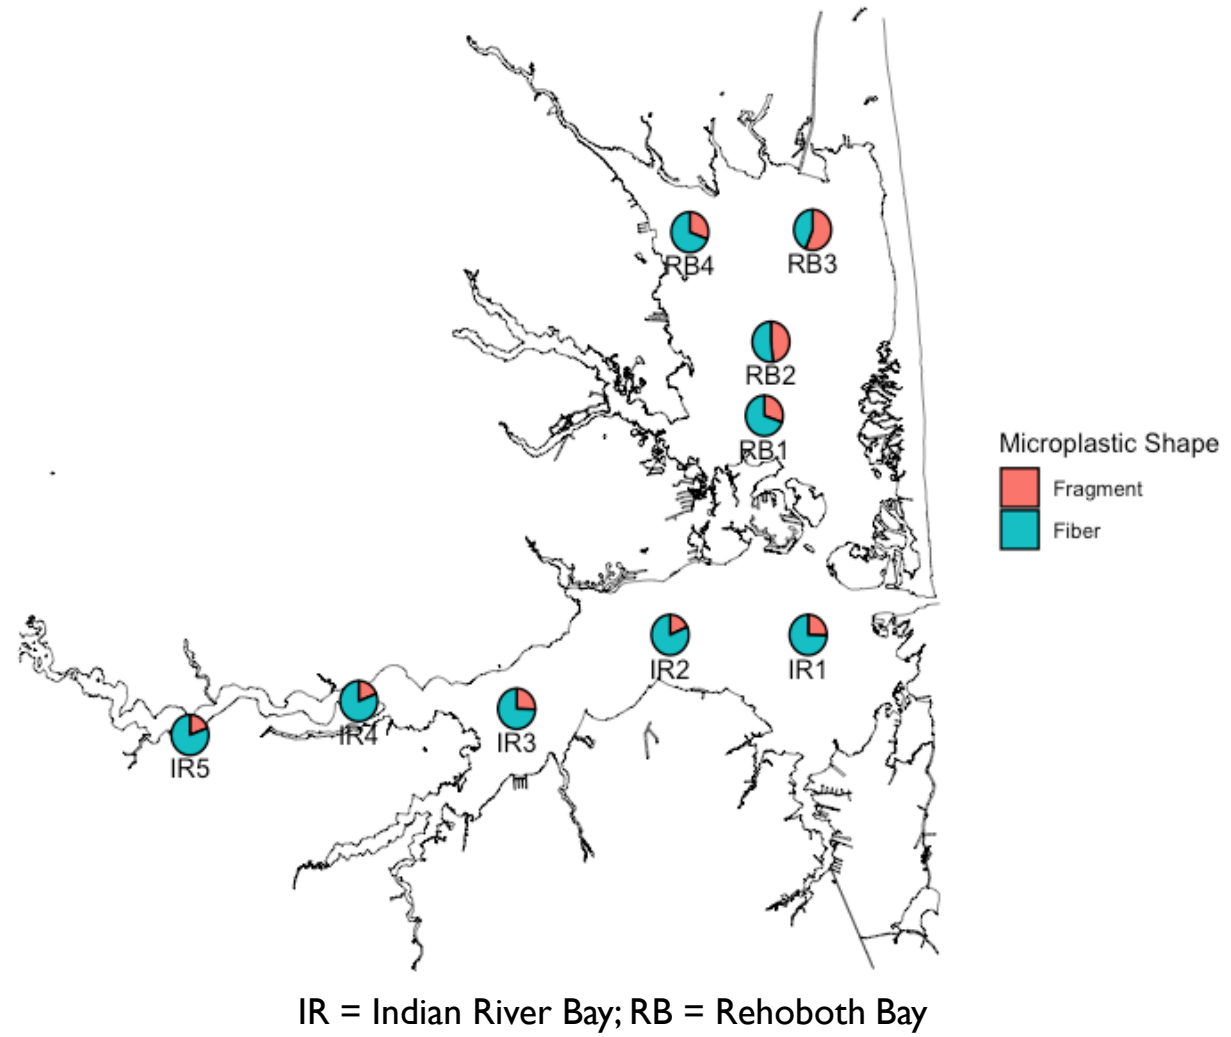

## Rehoboth Bay

Fibers: 59.4%

Fragments: 40.6%

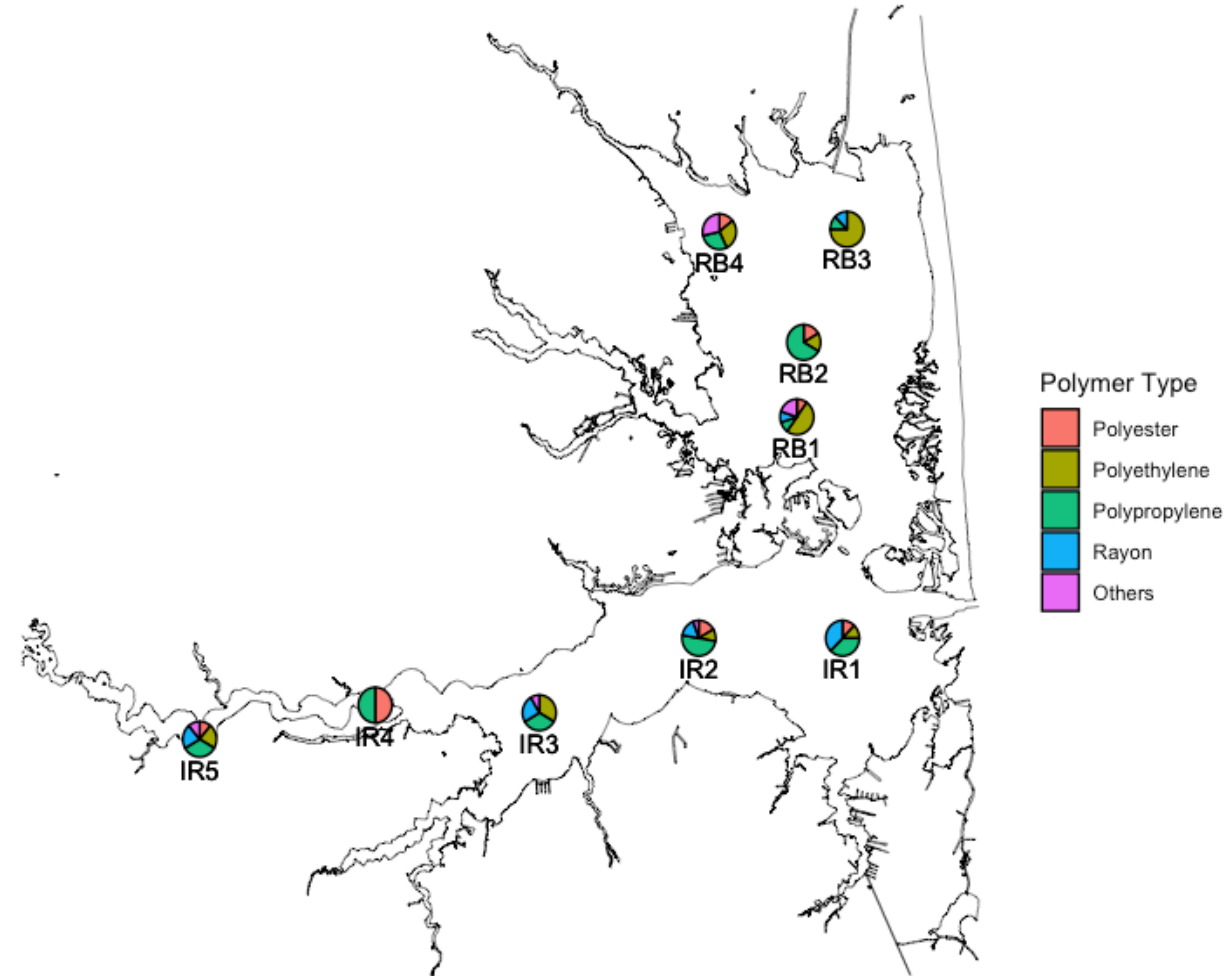

# JULY 29 (NET-BASED COLLECTION): MICROPLASTIC CONCENTRATION AND POLYMER TYPE

- 85% of tested microparticles ( $n = 123$ ) were microplastics ( $n = 99$ )
- Indian River Bay average microplastic concentration:  $0.7 \pm 0.3$  pieces/ $m^3$
- Rehoboth Bay average microplastic concentration:  $0.5 \pm 0.1$  pieces/ $m^3$
- Inland Bays microplastic concentration:  $0.6 \pm 0.3$  pieces/ $m^3$

- Polypropylene was the dominant polymer type in Indian River Bay (38%)
- Polyethylene was the dominant polymer type in Rehoboth Bay (45%)

IR = Indian River Bay; RB = Rehoboth Bay

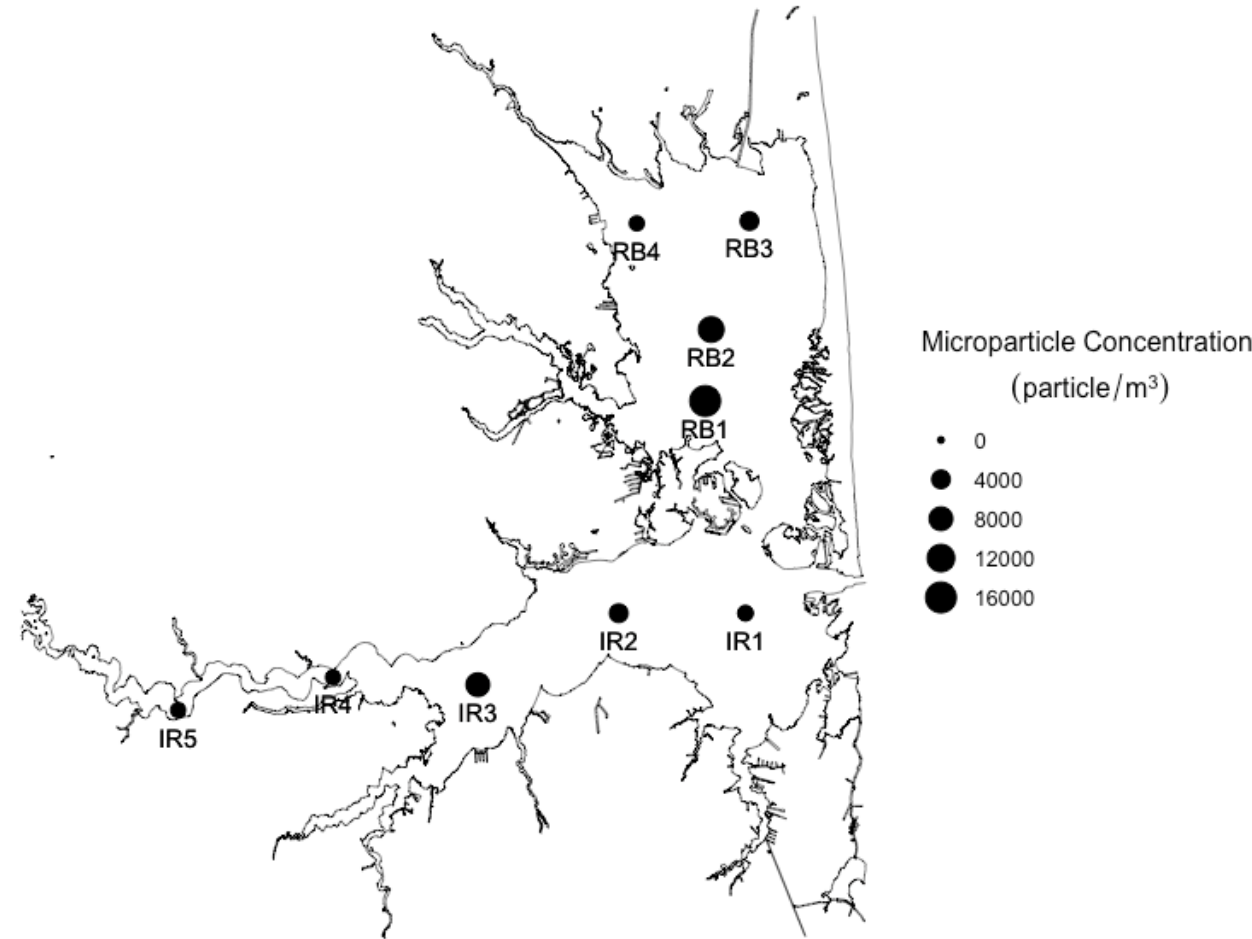

# JULY 29 (NET-BASED COLLECTION): MICROPARTICLE VS MICROPLASTIC CONCENTRATION

- Statistically significant relationship between microparticle concentration and microplastic concentration

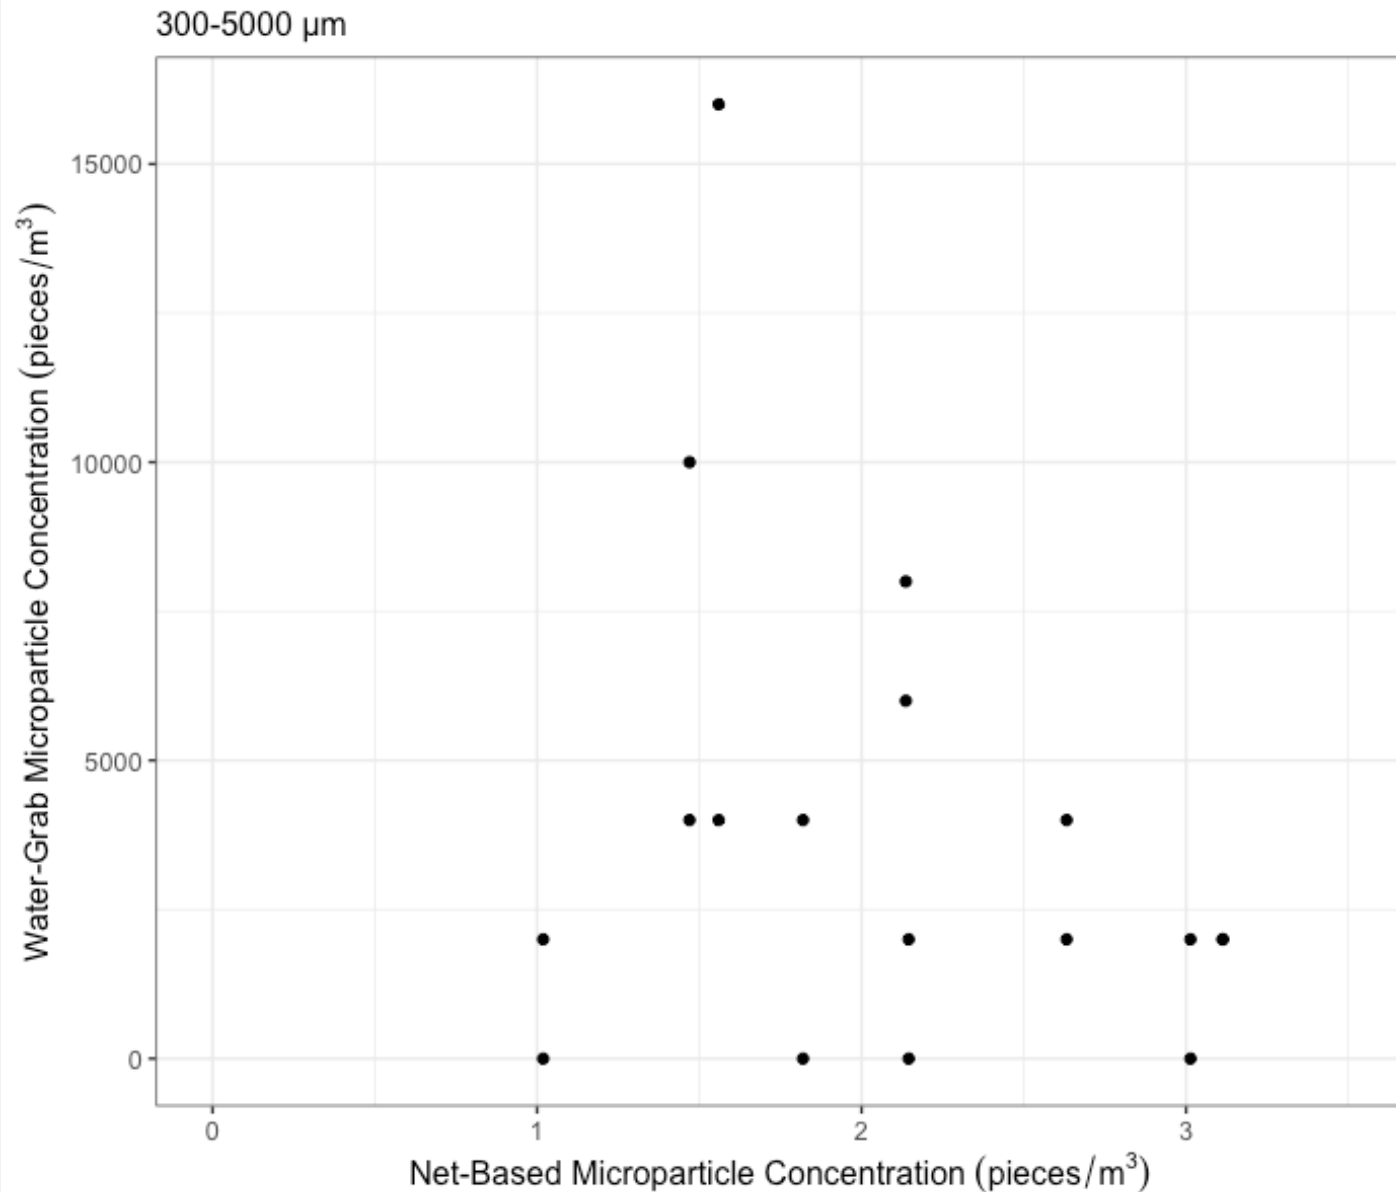

# AUGUST 12 (WATER-GRAB): MICROPARTICLE CONCENTRATION & SHAPE

- Indian River Bay average microparticle concentration:  $2800 \pm 2529.8$  pieces/m<sup>3</sup>
- Rehoboth Bay average microparticle concentration:  $5000 \pm 5451.1$  pieces/m<sup>3</sup>

IR = Indian River Bay; RB = Rehoboth Bay

# MICROPARTICLE COMPARISON: NETS VS GRABS

- No significant relationship between net-based and water-grab-based microparticle concentrations

# CONCLUSIONS

## Microparticle Concentration

Delaware  
Tidal Creeks > Inland  
Bays > Delaware  
Bay

- The majority of microparticles found in the Inland Bays are fibers.
- Polyethylene and polypropylene microplastics are the most prevalent in the Inland Bays.
- Water-grab collection results are inconsistent with net-based collection results.
- Nile red citizen science method potentially valuable for locating relative microplastic hotspots.

# Our Approach for Delaware Bay

## Observations from boats

## Computer simulations

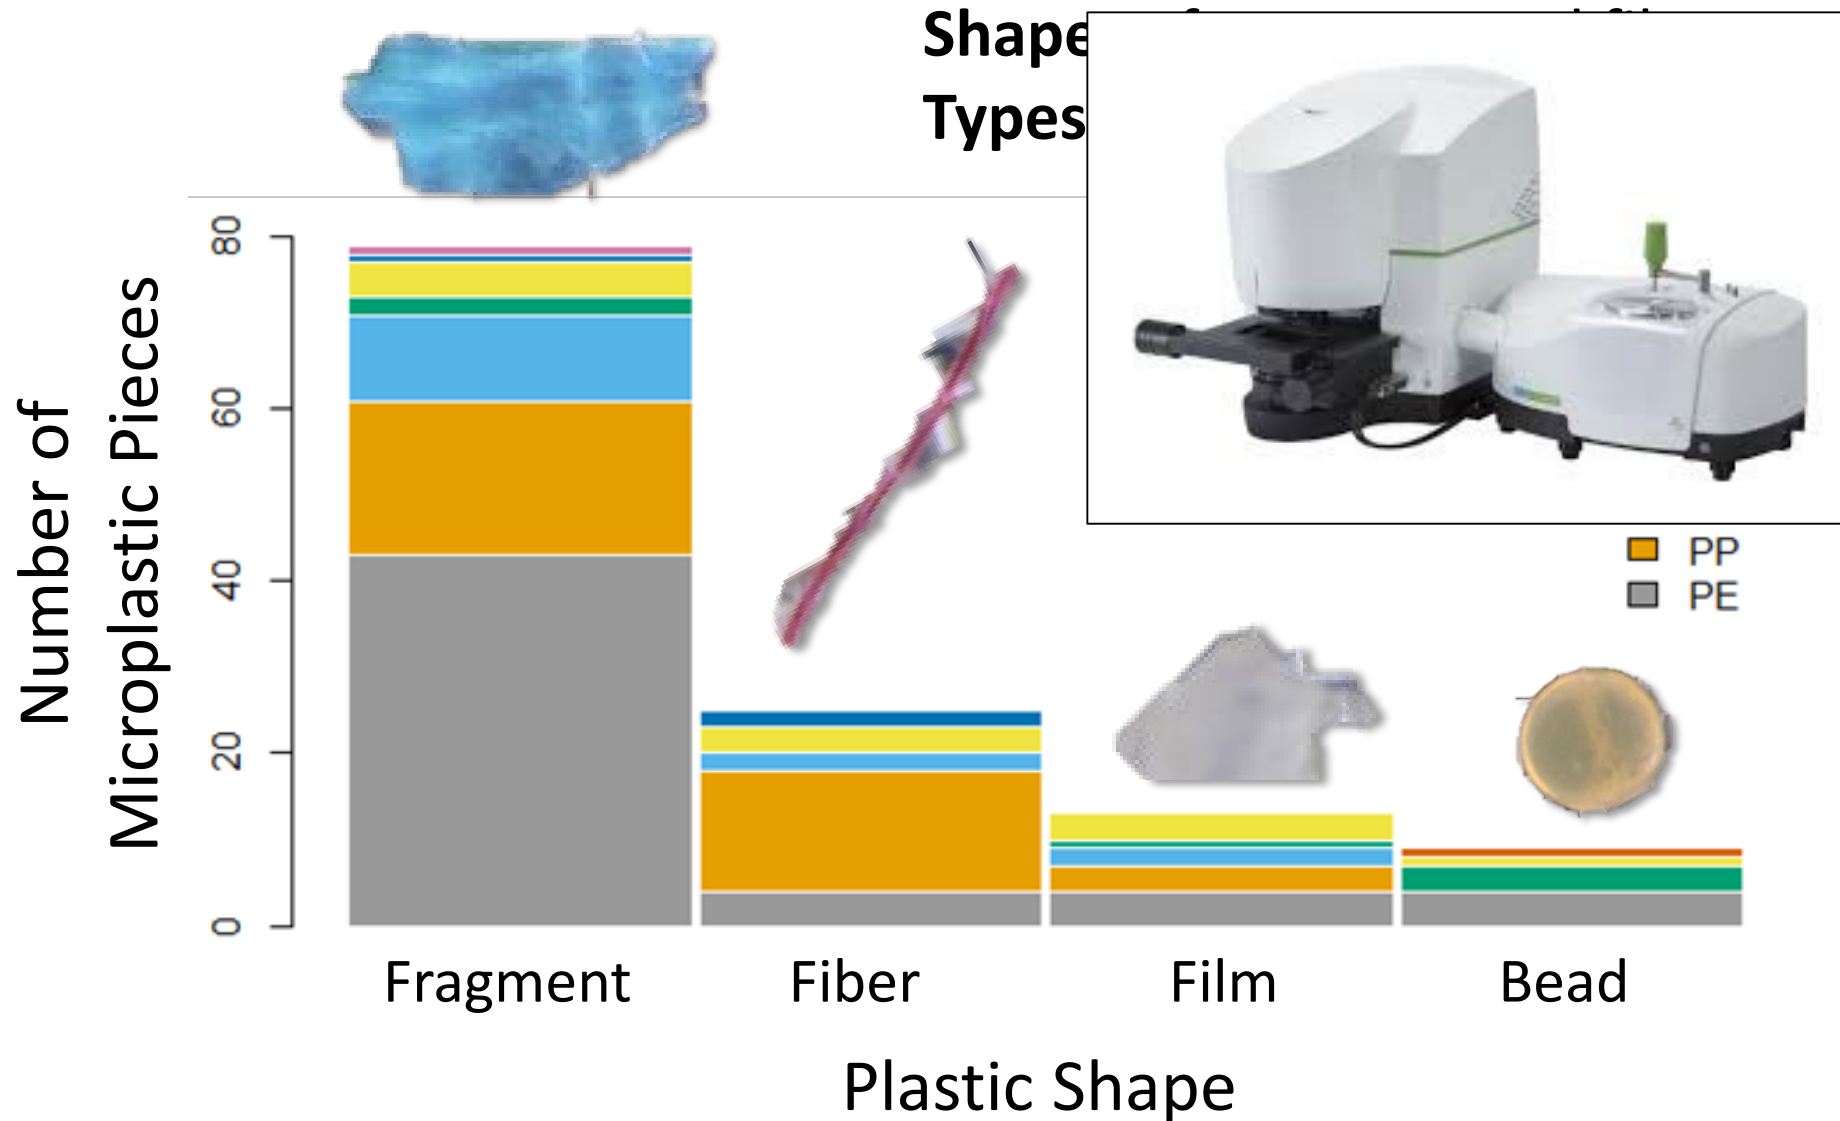

**What have we learned?**

# How much microplastic is in Delaware Bay?

- More plastic upstream
  - Higher population densities
  - Trapped in upper bay?
- Additional inputs from rivers around Dover (Murderkill and St. Jones Rivers)? *We'll return to this later...*
- Follows major currents and tidal movement in the Bay
- Overall: unexpected amount of variability across the Bay

# What plastic shapes & types are in Delaware Bay?

# Observations – net sampling – ETM in more detail

Retention within estuarine turbidity maximum

FitzGerald et al. 2015

# Observations – net sampling – ETM in more detail

Polymer types dominated by PE, PP, Rayon

# Computers can help us fill in the gaps

- What if we spread a layer of buoyant plastic particles across Delaware Bay, then let them float wherever currents and waves and wind pushed them
  - Buoyant particles are not homogeneously distributed throughout Bay
  - Instead, "hot spots" form where salty and fresher water mix

# So, how much microplastic is in Delaware Bay?

- <1 to 5 pieces per m<sup>3</sup>
  - Exceeds open ocean “garbage patches”
- There are likely areas (e.g., tidelines) with concentrations 100-1000x these levels

Microplastic piece

# GPS Drifters

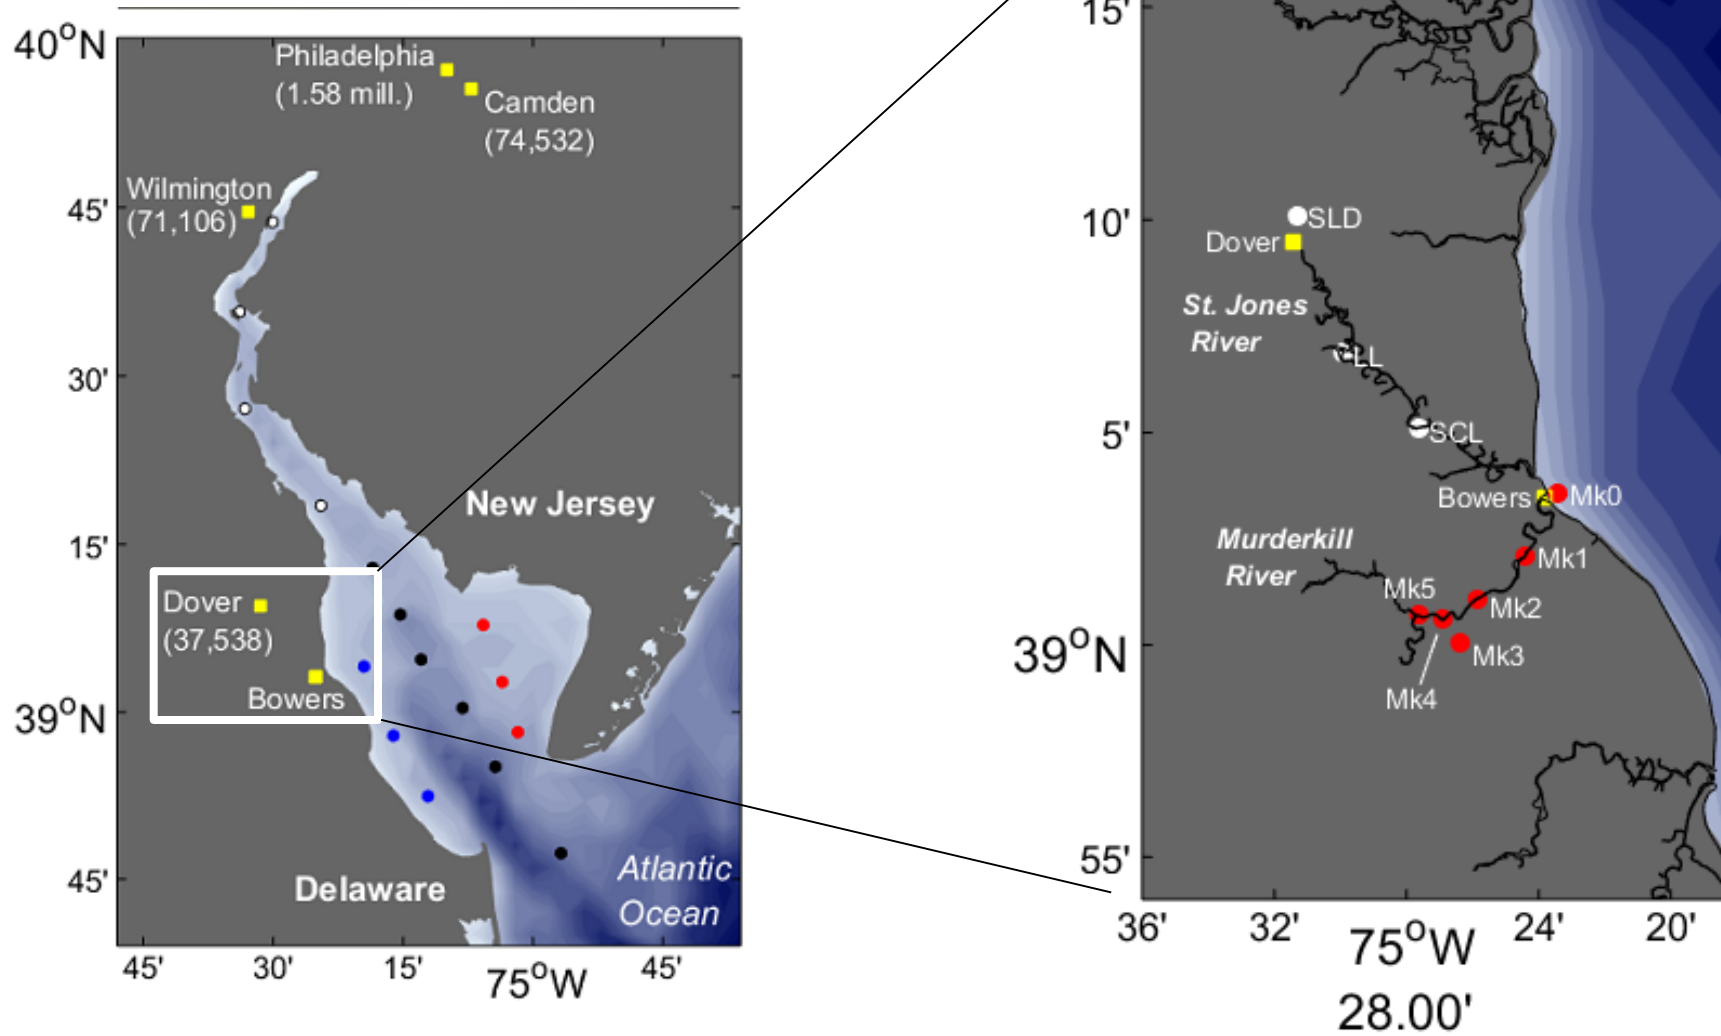

# Drift Cards

# Are tidal rivers sources of microplastics to Delaware Bay?

Summer 2019 study in the Murderkill River, DE

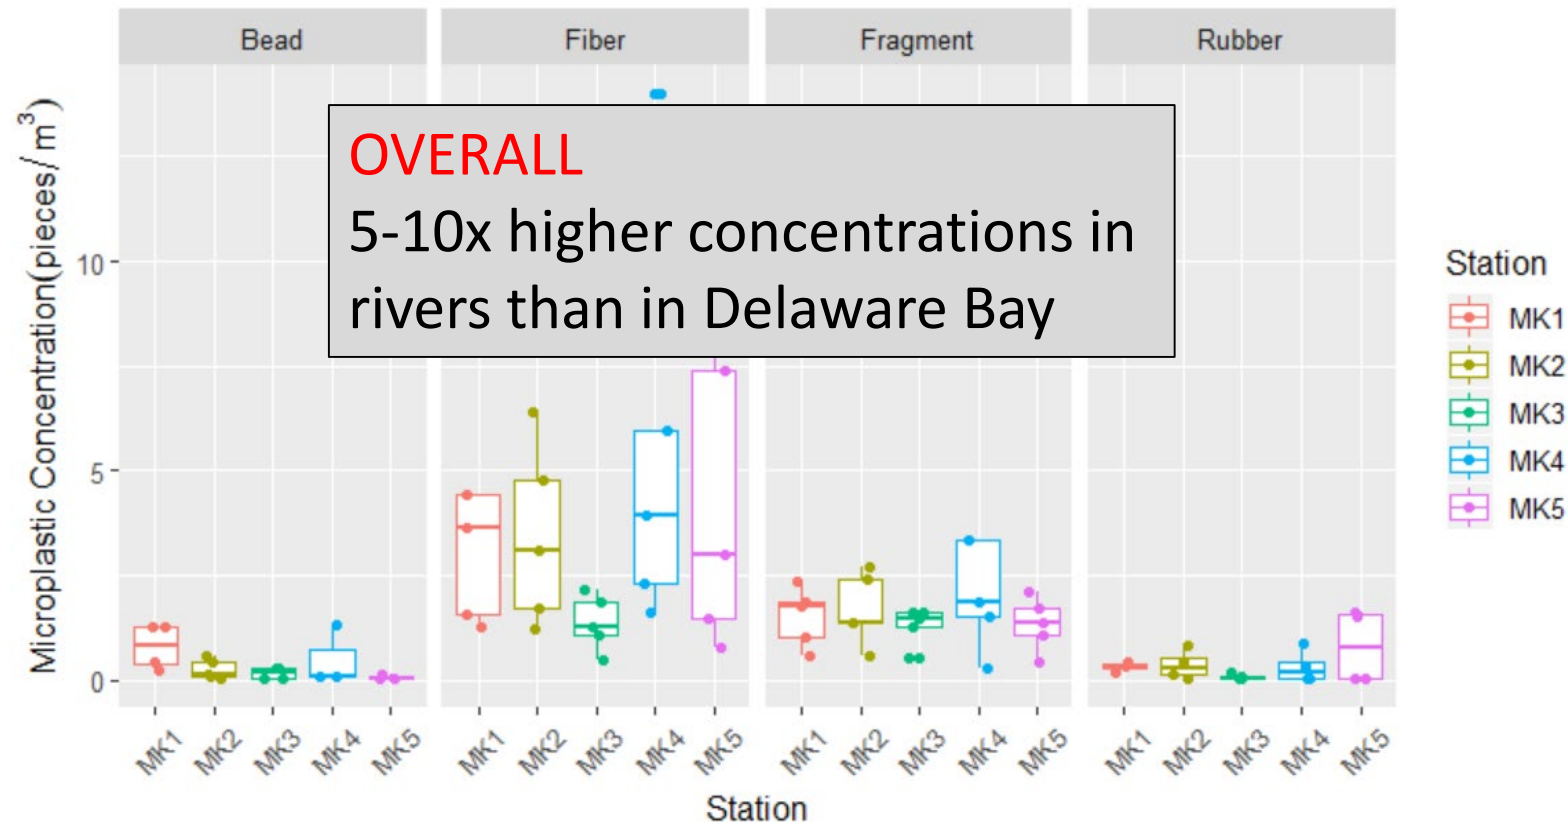

# Are tidal rivers sources of microplastics to Delaware Bay?

# Are tidal rivers sources of microplastics to Delaware Bay?

- Fibers are most common in the river
  - In contrast to Fragments in the bay
  - Similar to other areas (e.g., Chesapeake)
- Rubber upstream by Rt. 1, Beads downstream by beach
- No strong signal from the Wastewater Treatment Plant effluent

# Ecological Risk Assessment Framework

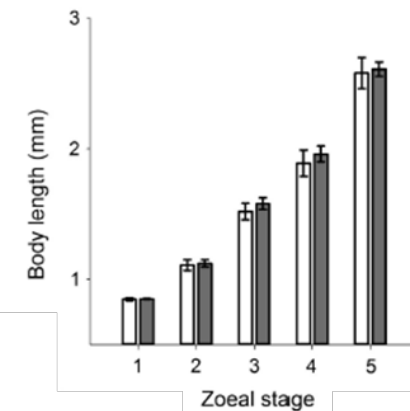

Modelling and Observations  
(microplastics & organisms)

- Determines time-integrated exposure (E)

Laboratory Experiments  
(survival & growth)

- Determines adverse response function (A)

Risk  
(R)

# Ecological Risk Assessment for MP exposure

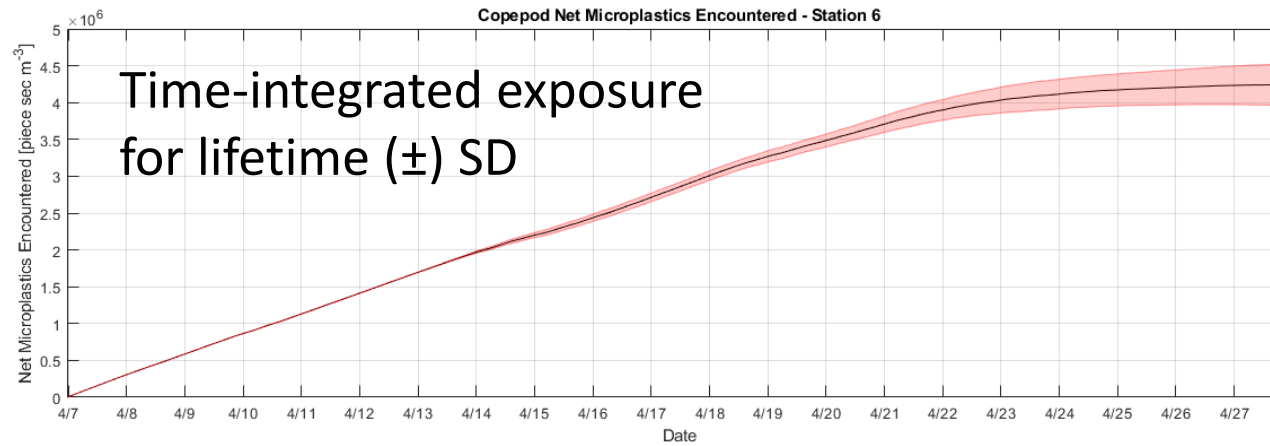

copepods  
and crabs

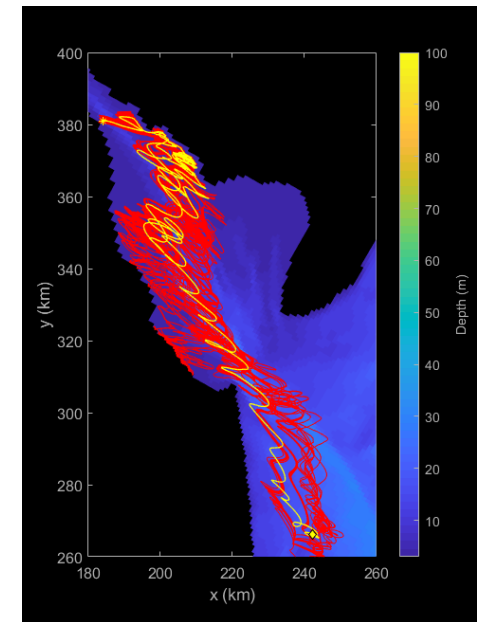

**Risk =**  
**MPMD Exposure**  
**x**  
**adverse response** at a given  
exposure level

Requires: (1) assessment of  
MP and organism distributions  
and (2) adverse response  
functions

# Model simulations for MP exposure in a copepod

50 “copepod” tracks  
from one mid-Bay  
station

Organism Net Exposure to Neutrally Buoyant Plastics

A

## Neutrally-buoyant Plastics:

- Upper estuary exposure far exceeds lower estuary exposure

Organism Net Exposure to Surface-Trapped Plastics

B

## Surface-trapped Plastics:

- High exposure in lower estuary accumulation zones
- Vertical migration reduces exposure

# Research going forward

- Relating land use to microplastic concentrations in waterways (sources)
- Understanding microplastics “hot spots” (fate and transport)
- Microplastic/organism interactions (ecological consequence)
  - zooplankton
  - shellfish and finfish
  - blue crabs
